Abstract (en)
[origin: WO2004111325A1] The invention relates to a method to improve the cleansing effect on non-delicate washing which is to be washed in a washing machine comprising a washing drum. The washing drum is driven in at least one A phase (intensive wetting) and in at least one second B phase (high wash mechanics) within the washing and/or rinsing processes. Said phases are successive at least once during said washing and/or rinsing processes. In the A phase (intensive wetting), the washing drum accelerates in the first rotational direction (+) upto a rotational speed n1 which is significantly greater than the applicational rotational speed and in the other rotational direction (-) upto a second rotational speed n2 which is significantly less than the applicational speed. In the B phase (high wash mechanics), the washing drum accelerates in both rotational directions upto rotational speeds whereat the individual items of washing are highly spun and are rubbed against each other.
