Abstract (en)

The description outlines a connector closing and reopening device for extensions and relative system of use of the type substantially comprising an instrument composed of two jaws (2 and 20) joined by means of a hinge (5) in which there is a first flat portion and a second saddle portion present. The device is devised to operate, moving from a resting condition in which it is inactive, is not used, to a first operative condition, in which a connector (10) is inserted into the flat portion of the instrument and flattened following pressing action, performed by a user, exerted on the instrument's handgrip, and to a second operative condition in which the connector (10), after being positioned in a specific seat (11) present in the saddle portion of the instrument, is brought back to the initial configuration, causing the said connector to spread open in a controlled manner, once again, following a pressing action performed by the user.
