Abstract (en)

[origin: WO2005009066A2] Disclosed is a method which allows for a fast and efficient establishment of a connection (5, 10) between members of a group, more specifically between a mobile radio user (1) who triggers the establishment (5-10) of the connection (5, 10) and additional mobile radio users (18, 19) of a group of mobile radio users via at least one mobile radio network (11, 12, 2, 13, 14, 15, 26, 16, 17). According to the inventive method, a first channel (5) that can be used for transmitting signaling data is set up when establishing the connection. User data, such as language, which is to be transmitted between the mobile radio user (1) triggering the establishment of the connection and other members (18, 19) of the group is also transmitted via said channel (5) in addition to the signaling data (6) until a second channel (10) is also set up for the connection (5, 10), whereupon user data is transmitted via the second channel (10).
