Abstract (en)

[origin: EP1647485A1] The machine comprises a support means (10) for at least one box suitable for receiving the group of objects and a feeding means (20) of the objects. Moreover a pair of manipulating devices (30A, 30B) is foreseen, each suitable for operating according to transfer cycles with which it picks up at least one object at a time from the feeding means (20) and arranges it in the box, said manipulating devices (30A, 30B) being actuated in a substantially uninterrupted manner, and each manipulating device (30A, 30B) operating so as to carry out transfer cycles that are staggered with respect to the other manipulating device (30A, 30B). In particular, each gripping member (31) is suitable for taking at least one object at a time from the feeding means to take it to the box to carry out said transfer cycle; the gripping member (31) of each manipulating device (30A, 30B) is mobile in a respective space separated from the space of the gripping member of the other manipulating device (30A, 30B) by an axial plane (P).
