Abstract (en)
[origin: US2011023402A1] A building element for use in construction of buildings and the like comprises a flat body portion and first and second connecting members. The connecting members can be attached to the body portion following manufacture or else they can be integrally formed with the body portion. The body portion and connecting members are divided by fold lines in order that they may be folded into particular shapes for use, e.g. a building block. Each end of the body portion has a means for engaging the other end of the body portion once the element has been folded into shape in order that the building element shape is retained. The connecting members also include attachment means that can attach the formed building element to other adjacent elements. The elements are formed from punched or cut sheet steel and/or plastics materials and are formed into the desired shapes on site by hand.
