Abstract (en)
An amusing mask (1) having composite formative variability function, which particularly integrates planar printed patterns with a three-dimensional form and produces variability therefrom, and is applicable for application in an air filter respirator. The present invention is configured to utilize the principle of closing and opening of the upper and lower jaws of the face of a person to actuate unitary animated simulation of the external appearance of a mouth of an animal or a cartoon figure. The present invention is primarily formed from upper (11) and lower (2) masks joined to mask holding members (12). The user can choose whether or not to combine adjoining decorations (4) or a blow toy (5) externally to the upper and lower masks and thereby achieve interesting and simulative dynamic amusement.
