Abstract (en)

The invention relates to a mechanism for the full or selective flushing of toilet tanks. The invention consists of a mechanism support comprising tilting elements which support floats, namely an outer float and an inner float, such that said floats co-operate to produce a full or selective flush according to the pressure exerted on the overflow tube. The outer float is connected to the tilting element by means of a system with vertical adjustment, such that said float can be moved vertically, thereby adjusting the quantity of water flushed during a partial flush. The invention can be used in the production of flush systems for toilets.
