Abstract (en)
The signaling device has a holding apparatus for holding an electrical signaling element in particular an incandescent lamp. The holding apparatus optionally holds an electronics mount with the holding apparatus having a guide apparatus for lateral guidance of the electronics mount to be installed. The signaling element can optionally be used and the electronics mount which can optionally be used have different holding elements. The guide apparatus is designed so that electronics mount to be installed can be plugged into the holding apparatus. The guide apparatus is in the form of a slot which is open on one side. The slot is aligned in the axial direction of the signaling appliance and the slot is open on that side of the holding apparatus which is arranged opposite a base. The electronics mount is broader than the holding apparatus. The width of the electronics mount corresponds essentially to the unobstructed width of the signaling appliance cross section.
