Abstract (en)

[origin: WO2005003517A1] The invention relates to an open-cooled component for a gas turbine, said component having an outer wall (20) that is subjected to a hot gas and at least partially defines a first cavity (15) for a first means. Said outer wall is provided with through-openings (3, 12) which open up into the cavity (15) on one side and into a hot gas chamber (21) on the other. The inventive component also comprises at least one second cavity for admixing a second means, said second cavity being connected to the through-openings (3, 12) in a fluid-connected manner. The aim of the invention is to provide a component for a gas turbine, which can be used to reduce flashback and spontaneous ignition during the supply of fuel to the cooling air. To this end, the second cavity is formed by supply channels (9, 13) provided in the outer wall (20), said supply channels being connected to the through-openings (3, 12) embodied as boreholes by means of transversal channels (4) in such a way that the two means can only be mixed once inside the boreholes. The invention also relates to a combustion chamber for a gas turbine, and to a gas turbine comprising one such component.
