Abstract (en)  
[origin: WO2005010449A1] The present invention relates to a regenerator for a cooler provided with a heat accumulation member having uniform ventilation and improved heat transfer performance. A plurality of mats are separated from a base mat formed by vacuum-sintering press of random wires. The plurality of the mats made from the base mat are inserted in series into a housing. According to the present invention, the mats are inserted into the housing in series so that the uniform ventilation is implemented in the entire housing. The heat transfer loss is minimized by boundary layer between neighboring mats, and the cooling performance of the cooler is greatly improved.
