Abstract (en)

The device has wire sections (3, 4) unrolled on a storage coil (20) in such a manner that the sections are synchronously rolled up during rotary motion of the coil in a rotary direction. The sections are fixed with their storage coil-sided ends to the coil. The coil exhibits a lock (33), which is effective in the rotary direction, with which the sections of the coil are rolled up. The lock is removable by an actuation equipment. An independent claim is also included for a motor vehicle with a device for synchronized moving in and out of wire sections.
