Abstract (en)

[origin: EP1653683A2] According to a scheduler algorithm setting method that is used for scheduling the transmission of packet data that are to be transmitted to mobile stations, a mobile station number threshold value setting unit sets a threshold value for the number of mobile stations that is to be used for determining switching between two scheduler algorithms that have been set. A mobile station counting unit counts the number of mobile stations that are performing communication within the same cell. The scheduler algorithm setting unit compares the number of mobile stations that have been counted with the threshold value, and based on the result of this comparison, selects the appropriate scheduler algorithm, and sets this scheduler algorithm in a scheduler that performs scheduling of transmission of packet data.
