Abstract (en)

A heating device includes a substrate (1) added with a functional far infrared material, an electrothermal film layer (2) coated on a surface of the substrate (1), and two electrodes (3) mounted on two opposite sides of the electrothermal film layer and each electrically connected to the electrothermal film layer. Thus, the electrothermal film layer co-operates with the functional far infrared material contained in the substrate to produce heat by conduction of the two electrodes so as to heat an object to be heated, thereby simplifying the construction of the heating device, and thereby enhancing the heating efficiency of the heating device.
