Abstract (en)  
[origin: WO2005011361A1] A plant container (10) including at least one section (18) of flexible material having an inner and an outer surface (32, 36). The inner surface (32) being formed at least in part by a lattice of recesses (38) and at least some of the recesses (38) converge towards a hole (40) through the material. The outer surface (36) is formed at least in part by a lattice of protuberances (48) at the same relative positional arrangement as the recesses (38). Each said section (18) is formed as a parallelogram having two acute angles (28a, b) and two obtuse angles (30a, b). Each section (18) is arranged to form a cylinder with adjacent ends (14, 16) overlapping and the protuberances (48) on the outer surface (36) of one end nesting within the recesses (38) of the inner surface (32) of the adjacent end at the overlap (20).
