Abstract (en)  
[origin: WO2005011423A1] The invention relates to a shoe, especially a closed half-shoe. Said shoe comprises an outsole, top material which defines the shoe inner part above the outsole, and an essentially oval inlet opening formed in the rear, upper region of the upper material. The foot of a user can be guided through the essentially oval inlet opening into the inner part of the shoe. Said invention is characterised in that a longitudinal axis EL of the inlet opening is offset at an angle beta in relation to a longitudinal axis AL of the shoe such that a front point E of the inlet opening, said front point being oriented towards the front end of the shoe, is offset on the inside of the shoe. The angel ss ranges from 5 DEG - 15 DEG . Additionally, the upper side of the outsole comprises, in the region of a rear third point HD of the length of the inserted foot, a sloping inclination of less than angle a on the outer side of the shoe and the angle a ranges from 1.5 DEG - 10 DEG .
