Abstract (en)

[origin: FR2858585A1] The axle (1) has two longitudinal arms (2, 3) that are transversely linked by a crossbeam and an anti-banking bar (5). Two ends of the bar are integrated with respective sides of the arms, such that the bar provides a torsional rigidity about an axis parallel to an axis of the bar. One end of the bar is integrated with associated arm due to the torsion of the arms end around an axis parallel to the associated arm.
