Abstract (en)

[origin: EP1510892A1] Method for operating a multi-component technical plant, especially a combustion power plant for generating electrical energy, whereby during operation of the plant as the components are activated and deactivated, they trigger an evaluation of at least another component. The resultant value numbers of each component are summed and from the summed values the next components to be switched in or out are determined. At least one component is assigned an initial value, which is added to the summed value numbers for the component. An independent claim is made for a control system for operating one or more components within a complex technical plant.
