Abstract (en)

The device has a slide rail (18) attached in an area of a frame (2), and a door leaf formed from segments (10) that are arranged one after another. A covering unit (24) extends over the entire length of the segments in a moving direction of the leaf. The covering unit projects from a plane of the leaf towards an inner side of the door such that the covering unit covers the frame area in which a roller and the slide rail are provided. An independent claim is also included for a garage including an overhead sectional door.
