Abstract (en)
The system has, at a coin refill, a cylinder (50) actuating a transmission system (54) that locks a slide (21), closing an opening of an access system (20), in a closing position. A key (40), at a coin reserve, actuates the cylinder when the refill is connected to the reserve to release the slide. A cylinder (24) drives a transmission system (52) that locks a slide (15), closing an opening of a base (14), in the closing position. An independent claim is also included for a process of connection between a reserve and a refill for the transfer of units between the refill and the reserve.
