Abstract (en)
[origin: EP1507050A1] The compound material strip (5) is pretensioned by the power flow element (1) and in the transition from this element to the compound material there is an extension element (4) or similar to prevent additional tension peaks when the strip is stressed beyond the pretensioning load. This extension element is connected mechanically or through adhesive to the compound material strip. Independent claim describes method for increasing tensile load of compound material strip by connecting tension-blocking element.
