Abstract (en)
[origin: WO2005019898A1] The invention relates to an optical device containing a dispersive element (1) and a projection lens (5), which define a splitting plane (7), on which a location is assigned to each light wavelength. A microstructured element (9) is located on the splitting plane, said element guiding light beams (13, 19), which emanate from different directions and are focused on the locations corresponding to their wavelengths, through the projection lens (5) to the dispersive element (1), which combines the light beams in a collinear manner.
