Abstract (en)

[origin: WO2005013595A1] The invention relates to a method for the transmission of additional information in a communication system (10), whereby a communication context connection (15a, 15b) is established from a first user station (11) to at least one second user station (12), for the transmission of information and/or data. Additional information is thus transmitted from an additional information device (14) to the second user station (12). The transmission occurs in a signal for the establishment of the communication context in a defined format, in order to permit a representation as electronic data card or ID card with text, image or multimedia content before the call reception. The transmission occurs, for example, depending on a release of the first user station (11) for the receipt of additional information. Query data are sent, for example, before the transmission. A selection can be carried out by means of a pre-selection or an additional code.
