Abstract (en)

[origin: EP1656973A1] The device has a rigid platform (3) with a rear plate (7) sliding longitudinally relative to a fixed point provided by mounting screws (47) due to elongated shape of recesses (46), so that the plate is slightly offset to the rear by the platform's movement during arching with deformation less than that of a ski. The platform has a tubular structure that defines longitudinal channels.
