Abstract (en)  
[origin: EP1657167A1] A suspension packaging system can include a foldable member (10) configured to form a cavity as well as a suspension device (14) for suspending an article to be packaged within the cavity. The suspension portion (14) can include foldable portions (114,116) configured to cooperate with a retention member (170) having pockets. The foldable portions (114,116) can fit into the pockets and then be folded so as to generate tension in the retention member (170). The entire device, with the exception of the retention member (170), can be made from a single piece of material, such as corrugated cardboard, which thus reduces waste and simplifies bulk distribution of such a suspension packaging system.
