Abstract (en)
[origin: WO2005009847A1] The pouring spout closure comprises a flange (1), for welding to a composite packaging or to the film material of a container sealed therewith and a circular edge (2), extending upwards from on the above and a combined lid (3) and pouring spout which may be rotated and clipped on said edge (2), forming a piercing cutter device (4). Said piercing cutter device (4) comprises a part (7) of the lid top (5), which may be opened up from the lid surface about a pivoting axis (11). Two piercing cutters (9, 20) formed on the underside of said piece (7), behind the pivot axis (11) thereof and in the vicinity of lid edge (6), are thus retracted out over the plane of the underside of the flange (1) and pierce the composite packaging or film running beneath the flange. The lid and pouring spout (3) are then turned on the edge of the flange (2) such that both piercing cutters (9, 20) cut out an approximately 360 DEG disc from the composite packaging or the sealing film and said disc is swung downwards.
