Abstract (en)

[origin: WO2005021975A1] The invention relates to a rotor assembly (10) for a turbomachine driven by liquid or gaseous agents characterised in that a first running wheel (12), a second running wheel and a third running wheel (14) are serially arranged on the axes (15, 16, 17) in a tube (11). Such arrangement of the running wheels (12, 13, 14) makes it possible to avoid cavitation during the turbomachine operation with directionally controlled flows and uniformly load the running wheels.
