Abstract (en)

To prevent the bottle from rotating during closing process, each sealing position has a container installation with increased coefficient of friction at a lateral device or support of the respective container. To press the respective container against the container installation, a belt device is provided, which has a circulating belt having endless loop. During the sealing process the loop length leans against the container and rotates synchronously with the rotor at the same speed. Sealing machine has powered rotor (4) which gets rotation from drive (9) and has locking tool (7) to apply a bottle cap (3) by raising the respective bottle (2) against the container plant (14) in sealing position (5) during the bolting procedure. Circulating belt (18) moves with pneumatic pressure.
