Abstract (en)  
[origin: WO2005024409A1] Disclosed are devices and methods for quantitatively evaluating the polypeptides contained in a body fluid sample and markers for detecting pathological states. The polypeptides are compared to reference values stored in a database. Said reference values are stored as data records of state-relevant polypeptides, which comprise at least one respective indication about the probability for the polypeptides to occur or the concentration thereof for a pathological state in samples of healthy and ill subjects.
