Abstract (en)  
[origin: EP1661630A1] An object of the present invention is to provide a paper sheet handling device capable of greatly reducing an amount of paper sheets which cannot be accumulated and which are accumulated in an OVF and capable of improving operation efficiency. A sorter has the certain number of stackers with respect to a specific division designating area. The fifth, tenth, fifteenth, and twentieth stackers of stage A, and the twentieth stacker of stage B are assigned to preliminary stackers. For example, when a stacker A08 becomes full, the nearest preliminary stacker A10 is used for tentative accumulation. When the full-state of the stacker A08 is cancelled, the tentative accumulation into the stacker A10 is discontinued, and the accumulation into the stacker A08 is resumed.
