Abstract (en)
A sound attenuating duct unit (55) for delivery of air to an inlet of a fan unit includes an elongate duct for transferring air to an outlet end adapted for connection to the inlet of the fan unit. This duct has a substantial bend formed therein and a splitter mechanism (76) is rigidly mounted inside the duct for providing sound attenuation. This splitter mechanism (76) is located upstream from the bend and extends longitudinally in the direction of airflow. The duct unit has a curved intake baffle (116) fixedly mounted in a lower end section of the duct (55) and this baffle (116) extends about and below a central axis (X-X) of the lower end section. The baffle (116) converges inwardly towards the outlet end (104) and is spaced from the central axis. Preferably, at least one vane member (132,134) is also mounted in the lower end section for turning the airflow to a horizontal direction and at least a portion of this vane member is curved in a vertical plane that is parallel to the central axis.
