Abstract (en)

[origin: WO2005025765A1] The invention relates to a device for the sorting of flat mailings, comprising pouches for individual mailings, circulating on a conveyor belt on two levels, the emptying of which may be controlled corresponding to the read target address and the sorting plan. The total circulation in the pouch loop (5) is carried out in several partial loops. The level transitions for each partial loop are adjacent within the total circulation, whereby on each level transition the conveyor belt is diverted inwards. The pouch loading stations (10) are arranged adjacently for each partial loop in the lower level.
