Abstract (en)

[origin: WO2005026471A1] The clamping element (14, 15) is supported in a positive fit on the base plate (3, 6) in the direction of traction of the traction element (1) in said anchoring for prestressed strip-shaped traction elements on supporting structures, especially concrete structures, whereby the traction element is received between a base plate which is fixed to the supporting structure and a clamping plate which can be clamped against the base plate and is fixed by adhesion and clamping. The clamping plate (14, 15) can comprise, on each side of the traction element (1), a retaining cam plate (20) which projects in a downward manner and which engages in a retaining recess (21) of the base plate (3 and/or 6), or can comprise a retaining projection (22) which supports a stop (23, 25) which is connected to the base plate (3, 6). The stops (23, 25) on the upper side of the base plate (3, 6) are welded push blocks which are arranged on both sides and/or in the region of the front side of the clamping plate (14, 15). The clamping plate (14, 15) can be secured in the position thereof such that it supports the base plate (3, 6) in a positive fit by means of a positioning device (26) which is mounted in a detachable manner in the direction of traction of the traction element (1). The positioning device (26) is a threaded rod (27) operating between the clamping element (14, 15) and a bridge (28) connected to the base plate (3, 6).
