Abstract (en)

[origin: WO2005028981A1] The invention relates to a mounting assembly (1) for a heat exchanger device, in particular for motor vehicles and to an additional unit that is traversed by or holds a fluid and that can be connected to said assembly. The assembly comprises a plurality of flow devices with a predefined length, which are arranged essentially in parallel along a predefined width, each having at least two connection sections at their ends, in addition to at least two collection and/or distribution pipes (3, 3') with a predefined length, which are located on the respective end connection sections of the flow devices in such a way that a medium can flow between the flow devices and the collection and/or distribution pipes (3, 3'). At least one mounting unit (11) for the additional unit that is traversed by or holds a fluid is located on at least one collection and/or distribution pipe (3, 3').
