Abstract (en)

[origin: WO2005027072A2] The invention relates to a sensor comprising a transmitter component for transmitting data via a line, whereby said line provides the sensor with power. The sensor transmits, at a point in time of supply with a first power level, the data for a first time interval. A second sensor which is connected to the line in parallel to the first sensor transmits its data for a second time interval after the first time interval. A timing control in the two sensors is triggered by the point in time of supply with power and ensures the subsequent transmission by the first and second sensor.
