Abstract (en)
[origin: WO2006015469A1] The inventive container with effects comprises a transparent body provided with internal and external walls and with illumination means which is arranged therein and comprises at least one light source connected to a power supply, wherein said container is also provided with at least two additional current conductive elements which are connected to said illumination means, made preferably of a transparent material and are disposed at least on two nonadjacent areas of at least external surface of the body in such a way that they are simultaneously bridged by means of a current conductive medium and are brought into contact therewith. In the second embodiment, said container with effects is also provided with at least two current conductive elements which are connected to the illumination means, made preferably of a transparent material and are disposed on at least two nonadjacent areas of at least external surface of the body in such a way that they are simultaneously bridged by means of a current conductive medium, are brought into contact therewith and with at least one sound source connected to the power supply and to at least two current conductive elements. The different ways for forming said current conductive medium are also disclosed.
