Abstract (en)

The device has lower and upper support units (8, 9) e.g. cradles, carried by a vertical mast (3), and supporting body parts (2). The unit (8) displaces in a radial direction with respect to the mast between a loading position, in which it is vertical to the unit (9) and facilitates access to the unit (9), and a body parts painting position, in which the units (8, 9) are shifted with respect to each other in the radial direction. An independent claim is also included for a process for loading the body parts to be painted on a support device.
