Abstract (en)
Method involves determining actual position of sheet (1) aligned towards front edge by position of two distant lenticular strips which is compared with evaluator and controller (30). Control value is generated, of the actual position deviating from target position, to realize, target position enabled advanced or lagging movement of plate cylinders (22.1-22.n). Control position is generated also to realize gripper system (18) or sheet retaining system (16) of sheet accelerating device (14) mounted in barrel (17). A peripheral stop-controller (24.1-24.n) is arranged to each plate cylinder.
