Abstract (en)

[origin: EP1666689A1] The present invention refers to a device for holding a shutter wing open, said device being formed in a manner that symmetrically to a hinge pivot (4) and parallel to the longitudinal axis thereof depressions (8, 9; 37, 38) are formed in a free bulky end (6) of a fixed hinge carrier (1) on the side facing a turnable hinge carrier (5), a wedge unit (10, 11) being arranged in each said depression. Said wedge unit comprises a slider (20) the cross-section thereof is adapted to the depression (8, 9; 37, 38). Here, a control rod (12, 13) is associated with the first side of each slider (20), while at least one conical finger (21, 22; 33, 34) is associated with the other side of said slider (20) in its longitudinal direction, said finger being moveably linked to the slider (20) by means of a pin (23, 24; 35; 36).
