Abstract (en)
[origin: WO2004100854A2] The equalizing device for a two-component cartridge (1) comprises means (16, 17) for removeably joining to the cartridge, a number of inlets (16, 17), which are separated from one another and which correspond to the number of components (5, 6), and at least one chamber (14, 15) comprising at least one outlet (21), whereby the outlet (21) is closed in such a manner that it is essentially impermeable to the components, however, it is pervious to air. A removable equalization device of this type enables the complete evacuation of air from storage vessels of multicomponent discharging devices, and the plungers (7, 8) of the discharging device are aligned at the same level so that all components simultaneously enter the mixer once discharging begins.
