Abstract (en)

[origin: WO2005024667A1] The usefulness, and consequently the performance, of advertisements (330) are improved by allowing businesses to better target their ads to a responsive audience. Location information is determined (or simply accepted) and used. For example, location information may be used in a relevancy (350) determination of an ad. As another example, location information (380) may be associated with price information, such as a maximum price bid. Such location information may be associated with ad performance information. Ad performance information may be tracked on the basis of location information. The content of an ad creative, and/or of a landing page may be selected and/or modified using location information. Finally, tools, such as user interfaces may be provided to allow a business to enter and/or modify location information such as location information used for targeting and location-dependent price information. The location information (380) used to target and/or score (350) ads may be include or define an area. The area may be defined by at least one geographic reference point (e.g., defined by latitude and longitude coordinates) and perhaps additional information. Thus, the area may be a circle defined by a geographic reference point and a radius, an ellipse defined by two geographic reference points and a distance sum, or a polygon defined by three or more geographic reference points.
