Abstract (en)

[origin: WO2005034493A1] Disclosed is a method for establishing a communication link from a first telecommunication device (TA) to a second telecommunication device (TB) via a telecommunication network (NW). According to said method, several multimedia objects (B1, B2, B3) of a telecommunication user (A) are stored in the second telecommunication device (TB) along with a reference number (RO). An allocation map (LA) is defined which indicates allocation of a specific call receiver to a specific reference number of a multimedia object. A request is then sent from the first telecommunication device associated with the first telecommunication user to the telecommunication network (NW), said request indicating that a communication link should be established from the first telecommunication device to the second telecommunication device allocated to a selected call receiver. The reference number that is designated to the selected call receiver is determined based on the allocation map (LA), and a call signal (IC) is transmitted to the second telecommunication device together with a displayed piece of information (AI) in accordance with the determined reference number, whereupon a multimedia object (B3) is reproduced by the second telecommunication device (TB) according to the displayed piece of information (AI).
