Abstract (en)

The toolbox is assembled of a lower and an upper shell joined with hinges at the back and fitted with two locking units (16, 22) and a handle (26) at the front. The locking units are designed as two flat elements (16) joined in an obtuse angle and provided with a projection (20) at the lower surface of the outer element. The inner element is connected to a flexible handle (26). When the outer element is pressed the projection (20) engages with a lock (22) attached to the shell and the inner element is lifted, moving the handle (26) into a carrying position. When the inner element is pressed the box is opened and the handle (26) pulled close to the shell preventing the insertion of the hand into the space underneath.
