Abstract (en)
When a living tissue (H) of a ligation target is ligated by means of a snare wire (5), the snare wire (5) is brought into contact with the living tissue (H) of a ligation target, on a large contact face by means for preventing living tissue cut-in of a ligation target of at least one of a distal end chip (23) and a rear end ring (24) of a loop section (4) of the snare wire (5), thereby preventing the living tissue (H) of a ligation target from cutting into a contact face of at least one of the distal end chip (23) and rear end ring (24) of the loop section (4).
