Abstract (en)
[origin: EP1672749A1] In a coaxial connector, a cylindrical insulator 19 is integrally formed to protrude from one surface of a substantially rectangular insulation base 18, and a tip portion 190 of the cylindrical insulator 19 has an enlarged diameter. An outer conductor shell 13 is provided that covers a circumferential surface of the cylindrical insulator on the side closer to the insulation base 18 than the tip portion 190. A notch 131 is formed in a front edge of the outer conductor shell 13 and a protrusion 192 formed to protrude from a rear end of the tip portion 190 of the cylindrical insulator 19 toward the insulator base 18 enters the notch 131 so that the notch 131 and the protrusion 192 engage each other in a circumferential direction of the cylindrical insulator 19.
