Abstract (en)

[origin: EP1674634A1] This invention discloses a window frame adapted for standardized manufacture, which comprises two side frame members, a top frame member and a bottom frame member, with all frame members coupled together to form a rectangular frame structure. Each side frame member defines a concave central cutout for receiving a central hinge and a support means at a longitudinal central portion of its inner wall, and a concave top cutout for receiving a top hinge at a longitudinal top portion of its inner wall where the top frame member connects with the side frame member. Further, said central and top cutouts are arranged at an upper portion of the side frame member and extent upwardly to a top edge of the side frame member. A window frame with such a structure may be standardizedly designed and manufactured to reduce manufacturing cost.
