Abstract (en)

[origin: WO2005035306A2] The invention relates to a device for locking at least one load to a chassis part of a transport means. The invention is characterised in that the device comprises a body (1) which can be fixed to part of the chassis and which is equipped with an articulated clamping jaw (2). According to the invention, the clamping jaw (2) is pivotally controlled by a system of articulated connecting rods (4, 5) acting as a knuckle joint and is fixed to a control member (3) which is supported by the body (1), such that the jaw (2) can be pivoted in an angular manner from an open position to a closed self-locking position with part of the load. In addition, the aforementioned knuckle joint is articulated to the jaw using a shaft (8) which is mounted in an elastic bearing (9).
