Abstract (en)
[origin: WO2005041712A1] The invention relates to a washing brush for cleaning objects, comprising a rotationally mounted brush head which can be driven by the gearing of a drive wheel which can be impinged upon by pressurized cleaning liquid. In order to further develop the washing brush so that high torque can be produced in the brush head at a low rotational speed, the gearing comprises two internally toothed, internally geared wheels which are oriented coaxially in relation to each other. One of the internally geared wheels is rotationally mounted. The other internally geared wheel is fixed. At least one coupling element, which is actively connected to the drive wheel and which is provided with external toothing, intermeshes simultaneously with two internally geared wheels and the two internally geared wheels have a different number of teeth.
