Abstract (en)  
[origin: WO2005033463A1] Assembly consisting of a roller and a drive. The roller serves for winding or, alternatively, unwinding a fabric blind thereon/therefrom. When the fully opened or fully closed position is reached a mechanical switch is operated in the drive between electric motor and roller by means of an end tab fitted on the fabric blind. This drive has a slipping clutch. As a result of the operation by the end tab, the drive to the roller is interrupted. The slipping clutch is so designed that the electric motor can continue to run for some time without actual damage.
