Abstract (en)

[origin: FR2859789A1] The automaton has a cap lifting unit with a handle including a shoulder that is engaged under an edge of caps (4, 5) of tubes (2, 3) that hold biological sample. An activation unit activates the handle in a direction tangential to a trajectory of a cap edge when the cap is tilted or rotated. A centrifugation rotor having housings positions the tube, and nacelles receive the tubes.
