Abstract (en)

[origin: EP1679408A2] The device has two parts defining a cross hole in which a clasp unit of a platform is housed, and a passage aperture for another clasp unit of the platform. Integrated bars (9a, 9b) of the platform are mounted movable in rotation between an end position in which the bars extend parallel to a plane defined by the clasp units and another end position in which the bars perpendicular to the plane. An independent claim is also included for a work platform including an articulation device.
